

TRAFFIC MANAGER

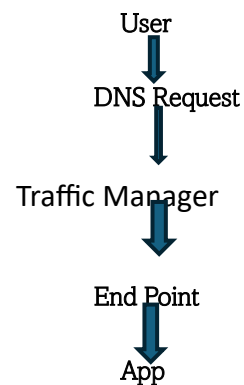

1. Traffic Manager is Responsible for Global Traffic_Management.
2. It helps to send the user to the nearest location if the servers are running at Multiple Regions.
3. It works on the DNS level and decides which server IP is going to give the user.

Example: when a user opens website

User from India = goes to Indian server

User from US = goes to US server

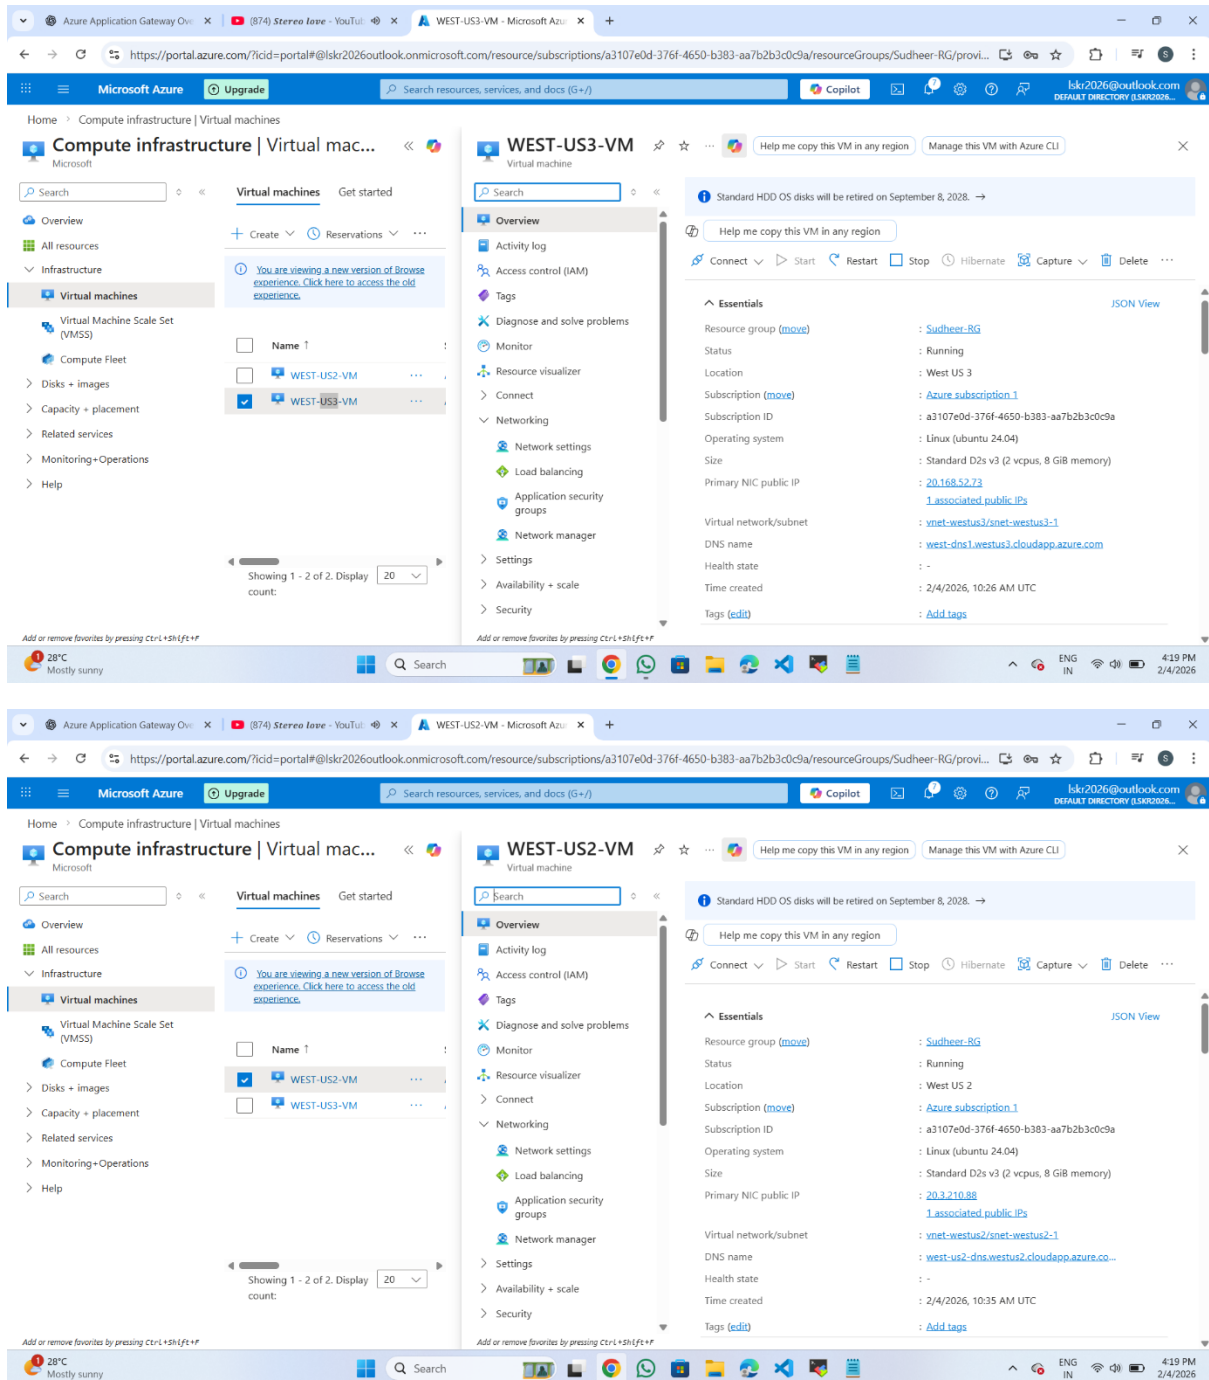

HIERARCHY

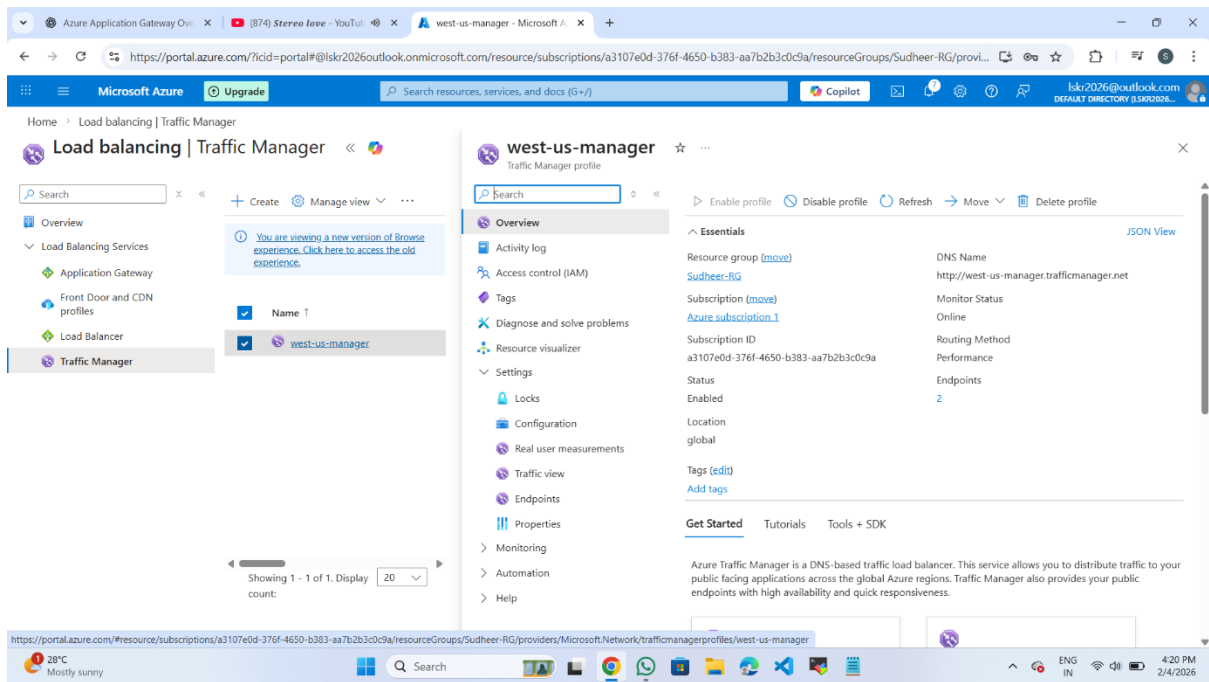

Routing Methods:

1. Priority/Failover
2. Performance (Nearest/Fastest)
3. Latency
4. Weighted

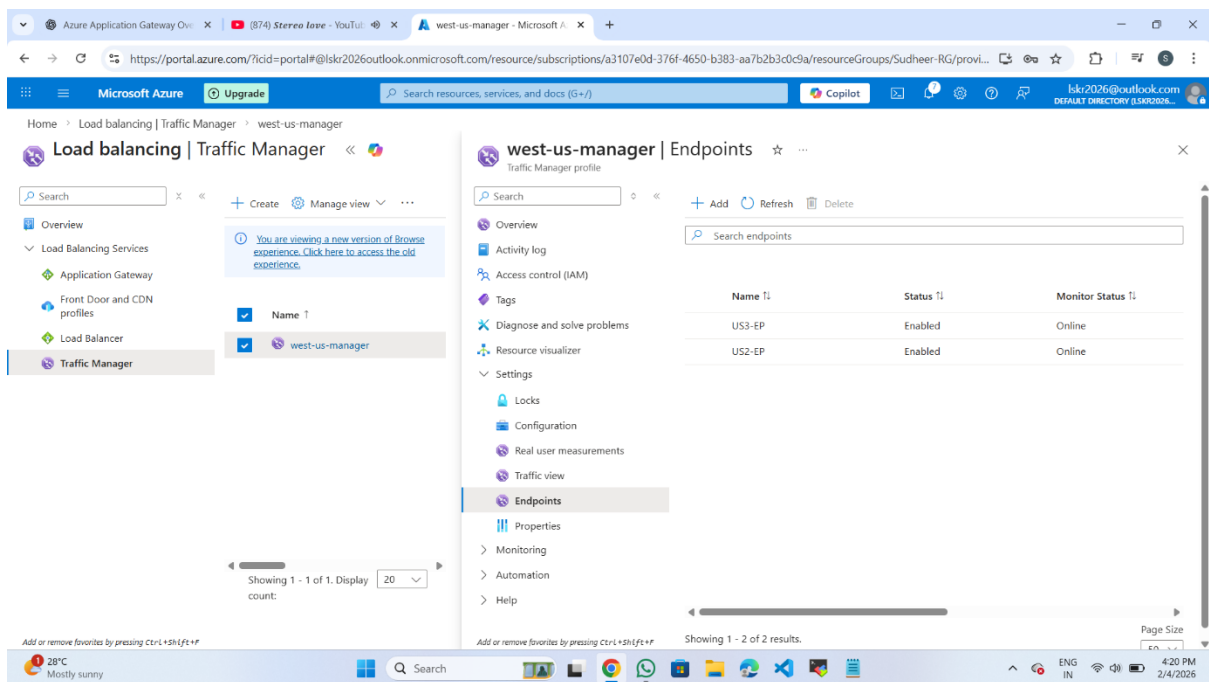

1. Here in This Traffic Manager, I have Created Two Virtual Machines in two Virtual Networks in different Regions.
2. And I have configured DNS for both the machines. Next I have created Traffic Manager and attached both The machines to the traffic Manager. While browsing with DNS name the result should be shown.
- 3.Following one are the Images

These are the two virtual machines that I have created In different regions called west us3&west us2.

This is the traffic Manager I have created for End Points.

This is the Image that I have attached two end points for a Traffic Manager.

Welcome to Traffic Manager!

If you see this page, the nginx web server is successfully installed and working. Further configuration is required.

For online documentation and support please refer to nginx.org.
Commercial support is available at nginx.com.

Thank you for using nginx.

This is the Final image I have got when I browse with the DNS name.
