

STORAGE ACCOUNT

1.storage account is a simple object storage where we can store massive unstructured data like

Images

Files

Videos

Documents

2.The storage account name should be unique across all accounts, and it should be lowercase letters and

Numbers.

3.The account should be in minimum 3 -24 characters.

4.After creating storage account, we will have 4 data storages. They are

1.container

2.file shares

3.Queues

4.Tables

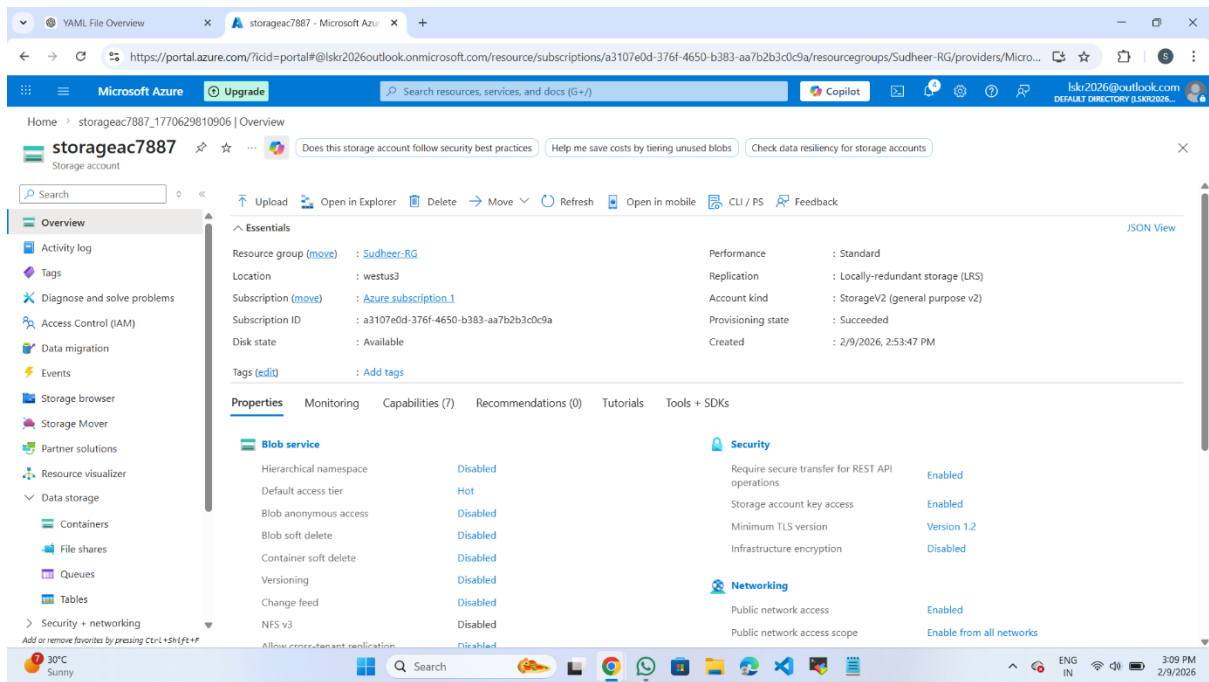

1.Container: container is a folder that holds blobs

2.File shares: It is an network shared folder which can be accessed by Multiple users.

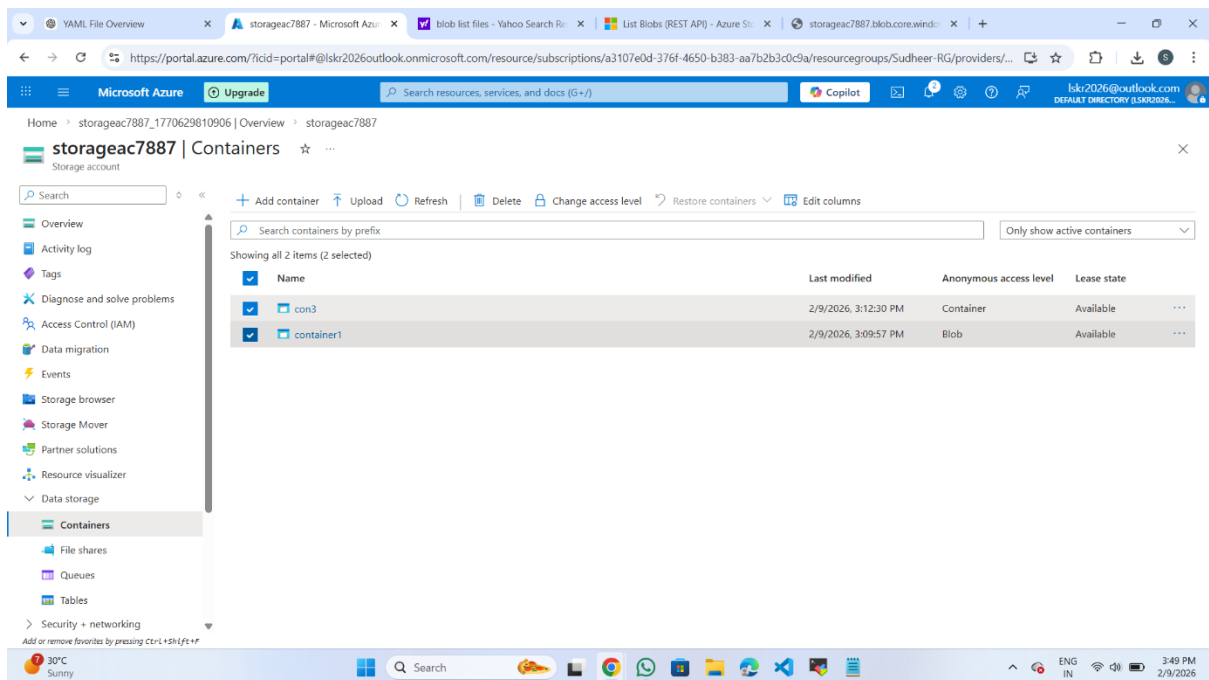

3.Tables: NO_SQL key value storage service used to store structured Data in cloud.

4.Queues: Queues are used to store temporary messages that will be Processed by another servi

Steps for creating storage account:

This is the storage account that I have created.

Next I have created two containers one is for blob and another one is for container.

In container1 I have uploaded aws image .because in blob we can upload only one image.

In container2 I have uploaded two files. Because container is for uploading multiple files.

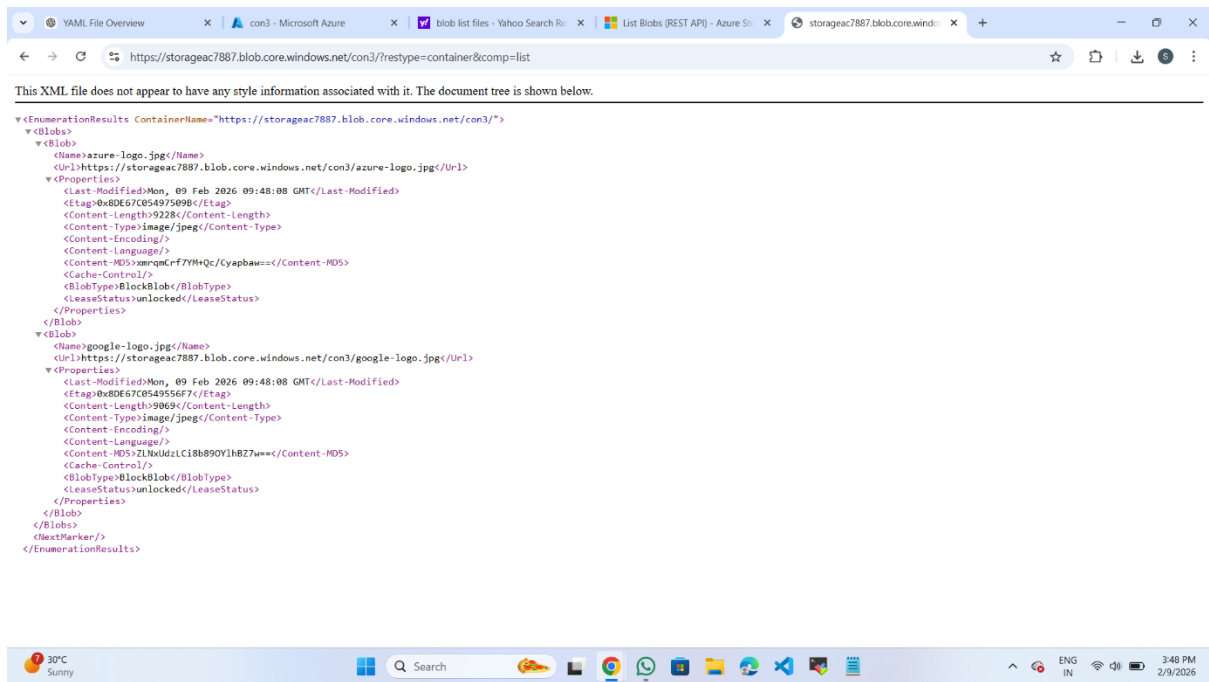

In container we can list images that we have uploaded by using blob list files.

This is the blob file

These are two files that I have uploaded in container.

These are the listed images.
